## Current Students and Post-Doctoral Researchers)

### Current Post-Doctoral Researcher

**Post-Doctoral Researcher**, *Geunsoo Jang*, PhD, NSF Center for the Analysis and Prediction of the Epidemic Expansion (APPEX).

### Current Doctoral Students (PhD)

Ongoing **PhD Student**, *Fahim Tasneema Azad*.

Tasnema’s research focuses on machine learning and data science. Her work emphasizes time-series and spatio-temporal modeling, causal inference, and forecasting in complex dynamic systems. She applies these methods to real-world problems, such as epidemic modeling, situational awareness, and data-driven decision support.

Ongoing **PhD Student**, *Ertugrul Coban*.

Ertugrul’s ongoing research includes projects in causal machine learning, such as the development of CausalBench, a benchmarking platform for evaluating causal discovery and causal inference methods within machine learning contexts. This research supports the broader goal of improving the accuracy and reproducibility of causal learning models across diverse data and application scenarios.

Ongoing **PhD Student**, *Abhinav Gorantla*.

Abhinav’s research focuses on machine learning and multi-objective optimization, with active work in causal machine learning and benchmarking frameworks. He contributes to developing CausalBench, a unified benchmarking platform for evaluating causal learning models and metrics, and works on optimized algorithms and causal analysis systems. His research spans both theoretical tools for causal ML evaluation and practical implementations of data-driven systems.

Ongoing **PhD Student**, *Ahmet Kapkic*.

In addition to his contributions to CausalBench, Ahmet’s work within the context of the PIRE project integrates causally informed methods into broader systems research, emphasizing causal discovery from complex, observational data. He is developing approaches that leverage causally-informed Petri nets to enable process discovery from time-series and system logs, blending formal process modeling with causal reasoning to better understand dynamic system behavior.

Ongoing **PhD Student**, *Pratanu Mandal*.

Pratanu's research advances causally informed data management and causal learning, particularly through developing benchmark frameworks like CausalBench that provide standardized datasets, algorithms, and metrics to evaluate causal inference methods. His research aims to overcome limitations of traditional data management techniques by leveraging causal knowledge. His work also includes application of spatio-temporal deep-learning and reinforcement learning approaches to complex prediction tasks, integrating causal insights into data-driven modeling.

Ongoing **PhD Student**, *Armin Hedzic*.

Knowledge graphs are useful in many querying and knowledge management applications, and some difficult data environments have use-cases that would benefit from models that could autonomously create or modify knowledge graphs with context over multiple modalities and/or data-sets. The focus of Armin's research is to solve challenges in this space by developing novel methods to discover or manipulate knowledge graphs to improve querying and knowledge management in difficult data environments with complex multi-modal relationships.
